- Determining Scanner Object Resolution

# Establish Height Reference Visionary-T Measuring Help Guide.

Measure the height of the scanner from the center of the lens to the floor.

## Establish Height Reference

Select “Mounting settings.”

## Visionary-T Measuring Help Guide.

Positioning the grid to the floor.

Rotate the grid clockwise by 90 degrees.

Then place the floor 1125 mm away, since the elevation of the scanner is 1125 mm.

Select “Grid” and “Device” on 3D live camera view.

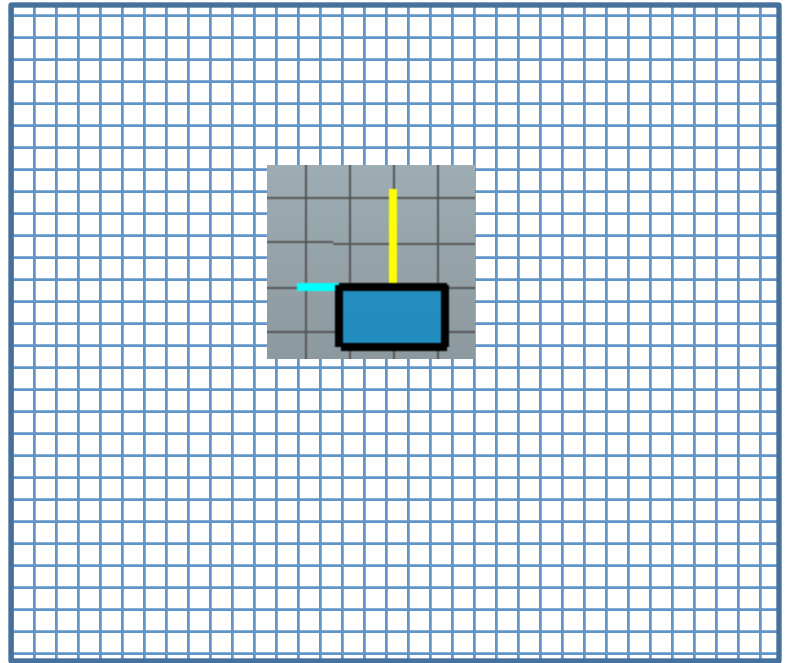

# Establish Height Reference Visionary-T Measuring Help Guide.

Grid coordinate positions

Top to floor grid peering top - down view

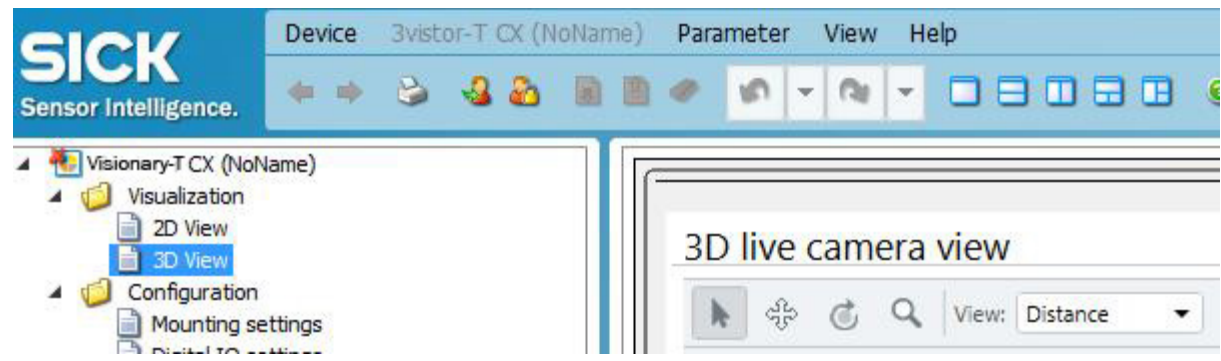

Y Axis

Z Axis

Select "Distance" for 3D live camera view.

X Axis

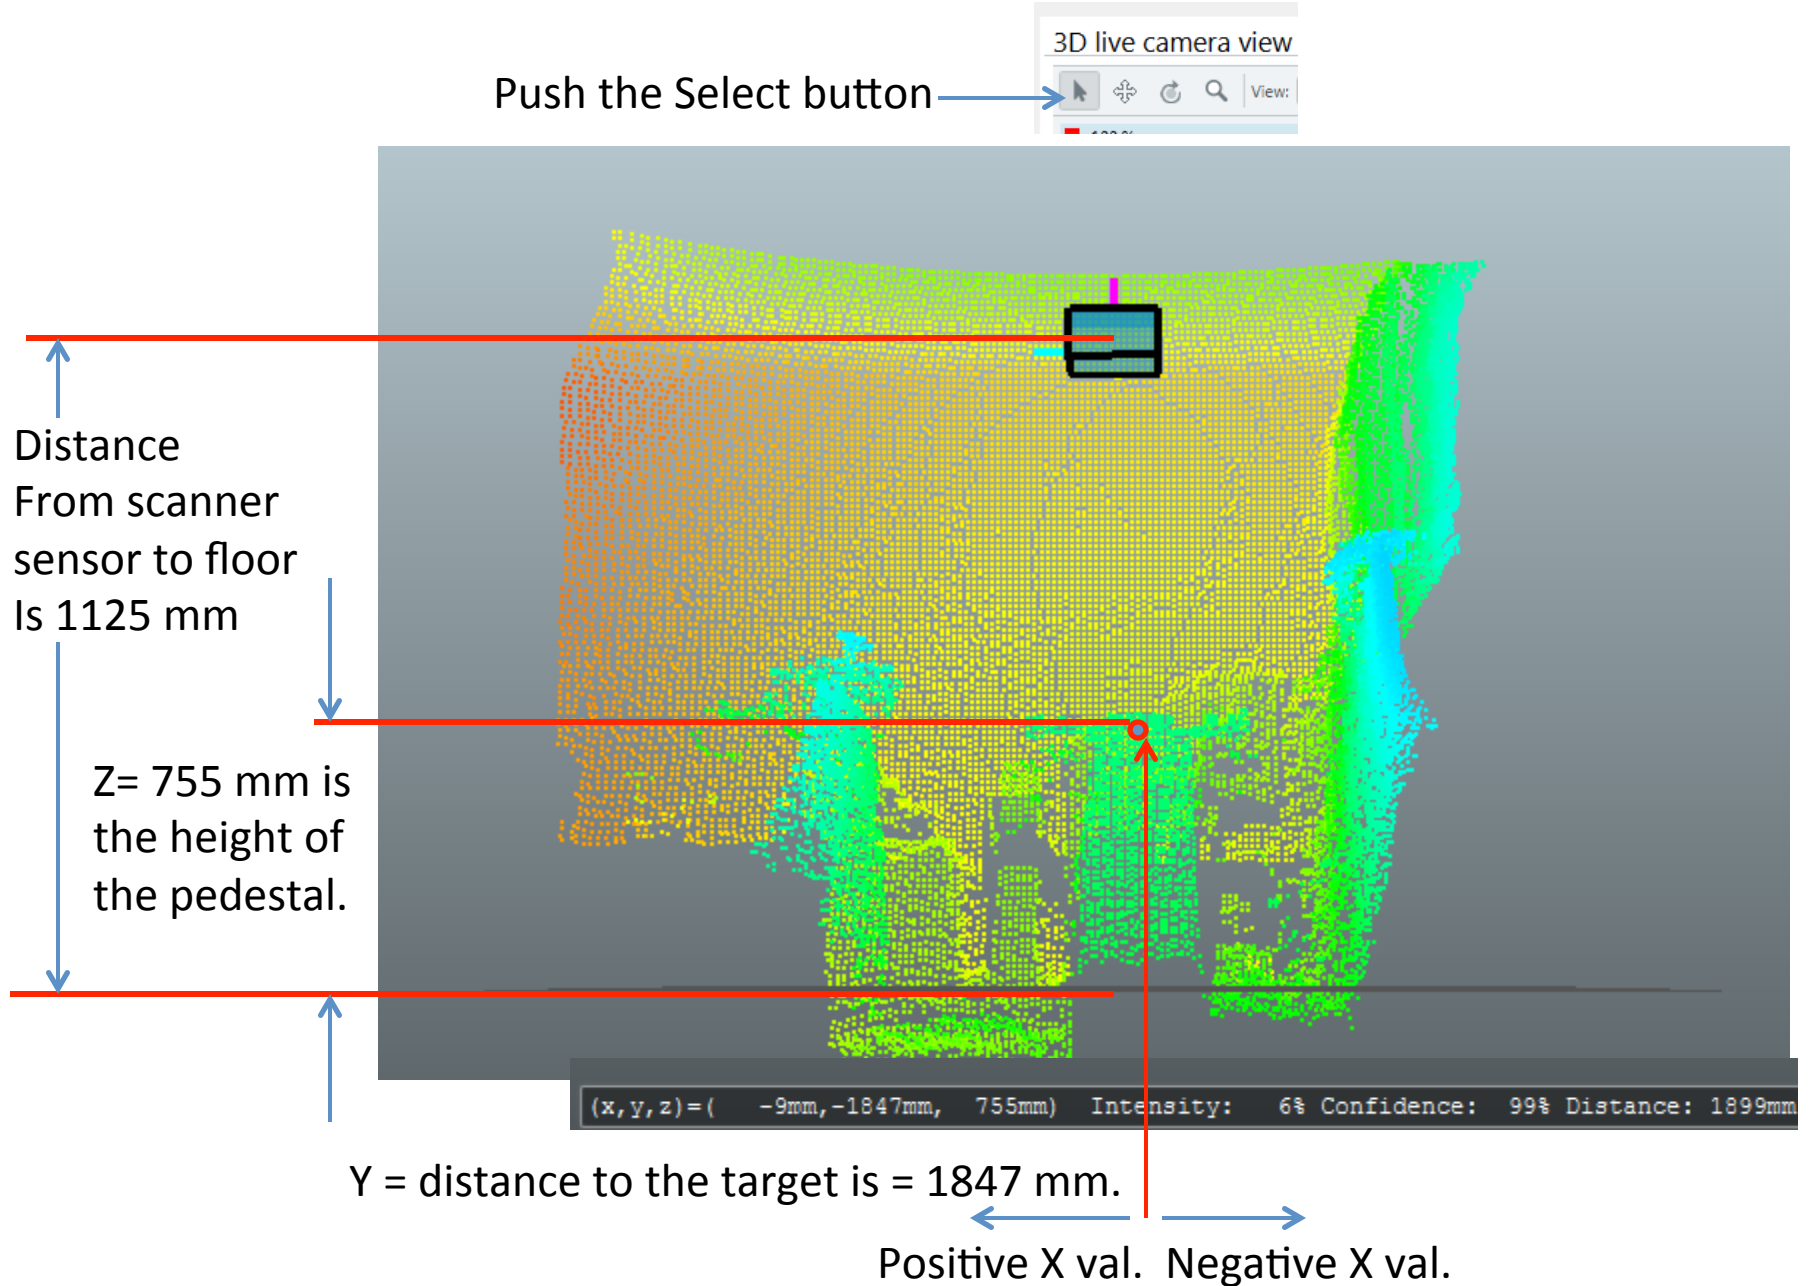

# Establish Height Reference Visionary-T Measuring Help Guide.

Grid  
Placed on floor  
relative to  
the scanner  
centerline.

# Determining Scanner Object Resolution Visionary-T Measuring Help Guide.

Scanner center is object center, in this example.

← Positive X val. Negative X val. →

To determine horizontal resolution at object center, place the cursor pointer at both pixel points. Horizontal resolution is  $9 + 4 = 13$  mm.

X = 4mm (x, y, z) = ( 4mm, -1848mm, 579mm) Intensity: 3% Confidence: 97% Distance: 1942mm

X = -9 mm (x, y, z) = ( -9mm, -1855mm, 577mm) Intensity: 4% Confidence: 98% Distance: 1949mm

# Determining Scanner Object Resolution Visionary-T Measuring Help Guide.

Scanner center is object center, in this example.

To determine vertical resolution at object center, place the cursor pointer at both pixel points. Vertical resolution is  $582 - 561 = 21$  mm.

The distance above floor is the Z val.

Z = 582mm

(x, y, z) = ( -9mm, -1841mm, 582mm) Intensity: 4% Confidence: 98% Distance: 1934mm

Z = 561 mm

(x, y, z) = ( -9mm, -1864mm, 561mm) Intensity: 4% Confidence: 98% Distance: 1962mm
